

Every configuration in the sweep — German removal vs collateral, English-only objective

One marker per (learning rate, lambda, training step). $x = 0$ is German at chance: left of it the language partly survives, right of it the edit has pushed past chance. Only English is defended; French, Spanish and Italian are undefended, so their panels show what each method does to them incidentally. Held-out blocks throughout.

- single component c3634 (112 scalars)
- LoRA r=1 (704,512 parameters)
- open = off-scale, clamped to the axis edge
