

Ablation curve on VPD's 67M Pile target — C = 4096, 4x pilot

Same study with a 32,768-position pilot instead of 8,192, because at C=4096 the smaller pilot leaves the row k-means only ~2 positions per cluster. Seed 2 of 5, chosen as the widest separation between the best arm and the current method. The ordering is unchanged — tokens beat parameters, magnitude beats normalised — so the C=4096 result is not an artefact of a starved pilot. Base CE differs from the 8k-pilot figure only because streaming 4x more Pile text changes which blocks land in the held-out eval set.

Full range (log y)

Zoomed — where each arm crosses $\Delta\text{CE } 0.05$
